

# Appendix 1.7: B2B AND B2G/AGORA INSTITUTIONAL COMPLIANCE REGULATIONS

*Transceptor Global Platform Specifications* | *Official Executive Regulation***Systemic Compliance Notice:** This document establishes the binding regulatory framework for institutional interactions within Transceptor Global. It enforces strict hardware and algorithmic separation between commercial B2B operations, state B2G integrations, and the direct democratic governance of the Decentralized Agora.

## 1. INSTITUTIONAL CIRCUIT SPLITTING (B2B & B2G)

### 1.1. Fundamental System Invariant

Financial, corporate, and political party capital is strictly isolated from direct or indirect voting power, political influence, and electoral weight in the Decentralized Agora. Legal entities, commercial enterprises, party associations, and state administrative organs are algorithmically assigned an effective voting weight of zero ($W_{\text{effective}} = 0$) regarding human rights, cultural ethics, and normative governance choices.

### 1.2. Individual Voting Sovereignty

The right to participate in referendums and normative decision-making within the Value Circuit belongs exclusively to natural persons who have verified their individual civic agency through W3C Decentralized Identifier (DID) passports and continuous Liveness Check procedures.

### 1.3. Atomic Proposal Split Protocol

To eliminate plutocratic capture, any proposal submitted to the platform that attempts to bundle financial sponsorship or budget allocation with normative/cultural mandates is automatically split by the Atomic Proposal Split module into two isolated components:

- **Value Component:** Submitted strictly to natural persons under direct democratic equality where 1 Person = 1 Vote ($W_{\text{user}} = 1.0$).

- **Mathematical & Resource Component:** Submitted to expert verification and algorithmic audit under dynamic meritocratic metrics ($W_{\text{user}} \in [0.01; 5.00]$).

| Circuit Type | Eligible Entities | Voting Weight ($W_{\text{effective}}$) |
|---|---|---|
| **Value Circuit (Agora)** | Natural Persons (DID + Liveness) | $1.0$ (Strict Isonomy) |
| **Mathematical Circuit** | Qualified Experts / Engineers | $[0.01; 5.00]$ (Meritocracy) |
| **B2B / B2G Corporate** | Legal Entities / State Organs | **$0.0$ (Absolute Isolation)** |

# 2. B2B CIRCUIT REGULATIONS (CORPORATE & ENTERPRISE)

## 2.1. Institutional Whitelisting and ZK-KYC

Corporate onboarding requires the issuance of an `SBT-Corporate` token following legal verification through authorized international jurisdictions, including the Swiss DLT-Act framework or Singapore MAS/ACRA registers. Compliance is executed via zero-knowledge protocols (ZK-KYC), enabling companies to prove legal standing, fiscal compliance, and tax status without publicly exposing Ultimate Beneficial Owner (UBO) structures.

## 2.2. Financial Clearing and Treasury Regulations

Primary institutional capital entries and settlement mechanisms operate under strict clearing rules:

- **Ingress/Egress Split Fees:** Standard capital entry split fees (2.50%) and exit fees (3.50%) apply according to global treasury rules.
- **RWA Collateralization:** Institutional deposits undergo 100% real-world asset (RWA) collateralization into sovereign treasury paper (T-Bills) with maturities up to 3 years.
- **Capital Immunity Threshold:** Corporate accounts maintaining locked reserves of $\ge $1,000$ for 365 days receive full service fee immunity covered by RWA yield.
- **P2P Barter Fee:** Direct peer-to-peer enterprise exchange fees are capped at $1.50%$.

## 2.3. Enterprise AI Compute Procurement

B2B participants gain access to high-performance GPU/NPU compute clusters and commercial BigTech LLM APIs (e.g., OpenAI, Google Gemini, xAI) charged strictly at pure provider wholesale cost-price. All enterprise telemetry, engineering schematics, and cost estimations are semantically anonymized inside Trusted Execution Environments (TEE)

under strict Zero-Data Retention (ZDR) agreements and Multi-Provider Routing ($< 4\text{ ms}$ latency).

### 2.4. RWA Tenders and Quadratic Auctions

Commercial entities may participate in RWA construction, engineering, and infrastructure tenders within the Mathematical Circuit. To prevent oligopolistic collusion and financial overcrowding, tenders utilize Quadratic Auction mechanisms where bidding costs scale quadratically according to $C(V) = V^2$. All submitted bid documentation undergoes compulsory three-layer vector AI audit (Law, Finance, Ecology).**B2B Infrastructure Invariant:** Financial power cannot acquire electoral influence. Capital deposited into the B2B circuit facilitates economic transactions, RWA development, and AI compute allocation, but generates zero governance weight in the civic Agora.

## 3. B2G CIRCUIT REGULATIONS (SOVEREIGN REGULATORS & STATE AGENCIES)

### 3.1. Prohibition of Collective and Party Accounts

Registration of collective, party, municipal, or state administrative bot accounts for voting within the Decentralized Agora is hardware-blocked. Public officials, state representatives, and regulators participate in civic governance strictly as individual natural persons bound by identical identity checks.

### 3.2. B2G Strategic Fork and SPV 51/49 Integration

Institutional collaboration between Transceptor Global and sovereign governments or central banks is executed through Special Purpose Vehicles (SPV 51/49) and the National Eco-Fund *Strategic Fork* framework:

- **SPV Structure:** Joint ventures maintain a 51% sovereign state / 49% platform structure to deploy local physical infrastructure, energy anchors, and logistics corridors.
- **Fiscal Autonomy:** Local municipal hubs (Oikoumena) retain absolute spatial subsidiarity over local assets, while the B2G layer interfaces with national regulatory frameworks.

### 3.3. RegTech Compliance and MPC ZK-Warrants

To satisfy international regulatory standards (e.g., FATF, OFAC, financial audit mandates) without compromising individual privacy, the B2G circuit implements a Multi-Party Computation (MPC) RegTech oversight architecture:

- **View Keys:** Institutional view keys remain encrypted across distributed multi-party nodes.

- **ZK-Warrants:** Regulatory decryption of specific transactional view keys is unlocked strictly upon presentation of a cryptographically valid ZK-Warrant representing a verified judicial order.
- **Automated Audit:** State budgets integrated into the platform operate through smart contracts, ensuring 0% corruption leakage in public procurements.
