

APPENDIX 4.2: EVOLUTION OF HUMAN LABOR, AI TECHNICAL SUPERVISION, AND COGNITIVE AGENCY

1. Architectural Specification of the Use-Case

- **Baseline Conditions:** Liberation of human labor from monotonous physical, computational, and routine algorithmic functions through automation, robotics, smart contracts, and AI Oracles.
- **Critical AI Task:** Transferring human subjectivity exclusively to the spheres of goal-setting, scientific search, strategic planning, engineering design, and ethical arbitration.

2. Key Subjectivity Roles and Operational Framework

- **AI Oracle Inspectors:** Auditing estimates, technical specifications, and detecting AI hallucinations or hidden loopholes in B2B documentation.
- **RWA Acceptance Specialists:** Instrumental physical verification of completed construction, logistics, and photo-voltaic objects using IoT, LiDAR, and GNSS technology.
- **Cognitive Arbitrators:** Participating in double-blind rotation (Double-Blind Rotation) within the Digital Agora for ethical and qualitative evaluation of initiatives.

3. Monetization of Man-Hours and PoUCC Accounting

- **Accounting for Live Cognitive Contribution (H_live_effective):** Accounting for expert hours is executed under the Proof-of-Useful-Cognitive-Compute (PoUCC) standard using the anti-spoofing formula H_live_effective = min(H_fact, H_benchmark) * Delta_S_useful from Appendix 1.3.

- **Discrete Quant Accrual:** Every verified cognitive contribution automatically earns discrete quants (+0.01) towards the Competence Index (delta I_cp) and Social Contribution Index (delta I_sc) in the user's W3C DID passport.
- **Phased Liquidity Release (Tranche Staging):** Payouts in T_net tokens for completed RWA projects are executed via staged escrow releases from TSB pools only after physical acceptance and verification by AI Supervision and Guild Inspectors.
